

Lab# 10: Learn Advanced Malware Analysis Platform**Objective: Use Glimps for advanced malware analysis**

Companies of all sizes face sophisticated security threats targeting their systems and data. Every day, employees from various departments – whether regular users, network/system administrators or cybersecurity professionals – download files essential to their work. But how do you ensure that these files are free of malware?

This is where GLIMPS Malware comes in

GLIMPS integrates into existing IT and security solutions, it does not just scan for known malware, this uses Deep Learning technologies to detect Zero Day malware and highly effective automation of binary analysis and threat detection. This offers two web portals designed to meet the varied needs of users within the organization, available on-prem and cloud.

- GLIMPS Malware Kiosk

This is designed to be both powerful and easy to use, increasing each employee's autonomy in removing suspicious files by enabling them to easily submit files for a fast, in-depth security analysis accessible directly from each employee's browser. When suspicious files are received, employees can submit them directly to the GLIMPS Malware Kiosk portal to quickly clear up any doubts about the security of suspicious files. This portal is designed to be intuitive and accessible to all, making it easy to submit files for analysis.

- GLIMPS Malware Expert

This is designed for cyber professionals, offering a granularity of information that enables each profession to find its own niche in file analysis. More advanced users can access detailed technical information that facilitates advanced investigations, such as IoCs and Observables identified by our engines, correlations with other sources of threat intelligence and additional artifacts found during file analysis.

Users of GLIMPS Malware Expert can access details of analyses carried out on our other products, ensuring security teams have a consistent and comprehensive overview of analysis activities.

Each analysis is automatically recorded in the history of the Kiosk and GLIMPS Malware Expert, the advanced file analysis and digital forensics interface. This enables the security team to track, and audit analysed files, ensuring effective traceability and management of security incidents.

If a threat is detected, the results are easily shared with the relevant managers to take immediate action and neutralize attacks, protecting the entire organization. What's more, GLIMPS guarantees the confidentiality of user data by not allowing analysis to be exploited by the company.

Step 1: Create a 30-day free account using <https://register.ggp.glimps.ca/en/>

Step 2: Download sample malwares from <https://github.com/LJ9859/Malware-Database>.

[Malware-Database](#) / [My-Viruses](#) / [Cancerous.zip](#)

Step 3: Upload the sample malware files to request for a new analysis.

Step 4: Click analysis details to check various static analysis options available

Description : Inspection of file: Setup.exe

Services : AdvancedStringExtraction, OfficeInspection, Phishing, SignatureAvira, GlimpsStaticUnpack, DeepEngine, WindowsExecutableAnalysis, YARA, EXEFiltering, PublicWhitelist, Extract, PrivateWhitelist, AutoitExtractor, ELF, EmailAnalysis, EmlParser, PEFile, SignatureClamAV, SignatureSophos

Step 5: Click ‘View Advanced’ for detailed report, which reports number of scan engines detected any malicious information.

File properties

Suspicious

0/5 engine detected, this file is suspicious

Setup.exe

Lab activities:

- Download sample malware and binaries
- Use the above-mentioned steps to use GLIMPS for Malware analysis.
- Create reports for at least three different malware – Binary, ZIP and DLL.
